

Klaro turns a bare USDC transfer into a **business-grade payment** — an issued invoice, a screened settlement, and a verifiable on-chain receipt — on Circle's Arc L1.

THE PROBLEM

A USDC transfer between two wallets is fast and final, but useless to a real business. It leaves no receipt anyone outside the two parties can verify and no audit trail an accountant can close a year on. It skips the sanctions screening every regulated payment provider runs, and it strands the vendor's value in a stablecoin their suppliers don't accept.

THE PRODUCT — ONE LOOP, FIVE STEPS

01 Invoice Vendor issues a hosted invoice; RLS-isolated per tenant.	02 Pay from any wallet Buyer pays in USDC, with CCTP V2 / Gateway cross-chain pay-in.	03 Screened settlement Operator screens, then settles into escrow on Arc.	04 On-chain receipt An audit-grade receipt is minted and shareable by hash.	05 Partner cashout Vendor previews local-currency cashout via LP staking.
---	---	---	---	---

WHAT'S BUILT — VERIFIABLE

20	contracts deployed on Arc testnet (chain 5042002)
531	Foundry tests — unit, fuzz, deploy-wiring regression
42	Postgres tables — RLS on every one
15	operator daemon workers — event listener + BullMQ
0.55	USDC — full-protocol deploy cost (gas is USDC)
Live	testnet demo — klaro-peach.vercel.app

WHY NOW

Arc makes USDC the native gas token with sub-second finality, and **CCTP V2** plus **Circle Gateway** turn cross-chain settlement into a primitive. Together they make Circle-native vendor rails — invoicing, screening, receipts, cashout — practical for the first time, rather than bolted onto a chain that was never built for stablecoin payments.

STATUS — HONEST MODE

LIVE TESTNET	Invoicing, payment, escrow settlement, on-chain receipts, disputes, agent jobs
SIMULATED	Fiat cashout leg; sanctions screening (mock until a provider key is added)
PARTNER PENDING	KYB, live sanctions feed, real cashout corridors — adapters coded, signatures outstanding
● VERIFIED RECEIPT · ON-CHAIN	

Every surface declares its mode. Klaro is a testnet product: no real-money movement, no real-INR settlement, no completed external audit. No PII is stored on chain.

ROADMAP

Harden testnet → External audit → Mainnet
